

Narcotics/Pain Medication Policy Andrea Saterbak, MD

- 1. It is normal to have pain after surgery and most of the pain does not represent damage or danger
 - a. Pain medications are to help manage post-surgical pain, not to take it away completely
- 2. You will be given a prescription for pain medicine at the time of discharge:
 - a. Please follow the instructions carefully
 - b. The instructions are a guideline, which allows for changes in the dosage including number of tablets taken and the amount of time in between doses
 - i. Narcotic pain medications may cause nausea and constipation
 - 1. High fiber diet and over the counter stool softeners can help with this. You can also try $\frac{1}{2}$ apple juice, $\frac{1}{2}$ prune juice and warm it up like a tea for constipation.
 - ii. Take medications with food
 - iii. Keep written records of when pain medications are taken

3. A limited number of refills are authorized depending on the type of surgery performed

- a. Due to insurance requirements, you may need to pay out-of-pocket for medication refills
- 4. In order to ensure timely service, be sure to include as much information as possible when requesting a refill:
 - a. Complete name and date of birth
 - b. Name and location of pharmacy
 - c. Name of prescription(s)
- 5. Prescription requests submitted <u>after 3pm</u> (<u>noon of Fridays</u>) will not be processed until the next business day, if authorized. Please allow 1–2 business days for prescriptions refill processing.
- 6. Refills will not be processed over the weekend by our on-call team
- 7. For your convenience, call your pharmacy before leaving home to make sure they have your prescription ready
- 8. Do not drive while taking narcotic medications
- 9. Pain management strategies:
 - a. ICE and ELEVATION work hand-in-hand with narcotic medication to provide pain relief
 - i. Half hour on, half hour off
 - ii. Elevate above the level of the heart

- b. Over-the-counter medications (Acetaminophen and Ibuprofen/Naproxen) aid in pain management and assist with overall decreased narcotic use
 - i. You can take Tylenol and NSAIDs simultaneously (they are different medications)
- c. Stagger the pain medications you're taking (don't take them all at once)
- d. For help with sleeping, try adding in Melatonin or Tylenol PM
